

# Getting Started with FLEA TREATS®

Thank you for choosing Flea Treats, a safe, natural, and effective method of flea control! Here's some information to help you get the most out of Flea Treats.

**First of all – they really are TREATS!!!** Most pets find the REAL LIVER in Flea Treats irresistible and eagerly take the tablets whole, as a treat! Flea Treats may also be crushed and sprinkled over your pet's favorite food or snack as a tasty topper. This is especially helpful for our dentally challenged pets!

## How they work:

When given as directed, Flea Treats cause your pet's skin to emit a powerful odor that fleas don't like. The odor is emitted by the skin cells themselves. The skin cells manufactured by your pet, once you've started feeding the Flea Treats, must work their way to the surface of your pet's skin. That's why it takes a little time for the Flea Treats to start working. Flea Treats contain water soluble vitamins that are not stored in your pet's system. No matter what kind of pet you have, please remember that Flea Treats must be given **daily as directed** in order to work. Maintaining the vitamin level in your pet is the key to success!

## Recommended Daily Intake for Adult Pets:

Pet Weight	Morning	Evening
0-29 lb.	1 tablet	1 tablet
30-69 lb.	2 tablets	1 tablet
70+ lb.	2+ tablets	2+ tablets

If your pet weighs over 70 pounds, add 1 tablet per day for every 20 additional pounds.

## Recommended Daily Intake for Puppies & Kittens:

Due to their higher metabolic rates and smaller bladders, puppies and kittens require larger doses than adult pets. We recommend adding an afternoon dose to maintain a constant level of vitamins.

## Recommended Daily Intake for Pregnant & Nursing Adults:

Pregnant and nursing pets may also receive a larger dose. Double the dose during the final 2-weeks of pregnancy, continuing until the litter is weaned. While they're nursing, B-vitamins will pass through the mother's breast milk to protect the litter. Once the puppies or kittens are weaned, they may be given their own Flea Treats.

**Pets with problem skin, hot spots, hair loss,** or other symptoms of allergic reactions to flea bites benefit from a double dose during the first few weeks of using Flea Treats. The additional B-vitamins will aid in the recovery of the affected areas. Once you notice improvement in scratching and itching, begin to decrease their dosage at a rate of 1 tablet every 4 to 5 days until the maintenance dosage is reached. At any step of the way, should the itching and scratching return, increase the dosage to the previous level and maintain the pet at that level.

**Extremely active pets** often require a larger dosage than more quiet pets of the same size.

**On average, Flea Treats take 2-3 weeks to "kick-in"**, however, every animal's metabolism is different. The chart above is the recommendation for the average pet. If you're not seeing the results you expect within 2-3 weeks, it is safe to increase your pet's intake. Because Flea Treats are water soluble, what isn't absorbed flushes harmlessly through your pet's system.
